Tokihiro Nakamura,
Governor of Ehime
Prefecture

The industrial structure of Ehime Prefecture is defined by a balance rarely seen anywhere else in Japan, with each prefectural region having its own unique industrial concentrations: secondary industry is abundant in the Toyo Region (eastern area of the prefecture), tertiary industry thrives in the Chuyo Region (the central area of the prefecture around Matsuyama City), and primary industry is dominant in the Nanyo Region (southwestern area of the prefecture).

There is a wide array of industrial cities in the Toyo Region, which are home to numerous manufacturing companies boasting advanced technology unparalleled elsewhere in Japan and producing top-quality products. In the field of manufacturing, a number of papermakers and paper processing companies have been around since long ago in Shikokuchuo City, its shipment value of the pulp / paper and paperproducts is the greatest in Japan. Following the opening of the Besshi copper mine in the Edo Period (1600–1868), Niihama City grew into the Sumitomo Group's "corporate castle town," becoming active in fields such as chemicals, machinery and nonferrous metals. Saijo City, on the other hand, provides an excellent location for steel industry operations, as well as companies operating in fields such as beverages, chemicals and shipbuilding. Imabari City is home to a number of world-renowned shipbuilding and shipping companies.

If we turn our attention to the Chuyo and Nanyo Regions, we encounter a rich tapestry of locally rooted, promising manufacturing companies that masterfully utilize the resources unique to their regions.

In 2011, the prefecture publicly sought data on manufacturing companies in Ehime possessing "SUGOWAZA," leading-edge technologies and sophisticated techniques. For the 2019 edition, we have added some companies and "SUGOWAZA" to the enhanced database, which now contains information on a total of 189 companies and 248 "SUGOWAZA."

We hope to use this database to widely promote, inside and outside of the prefecture, the appealing companies and industries that together form the "underlying strength" of Ehime Prefecture, with the goal of both extending their markets and providing cross-industry matching services.

If you work at one of the companies that strive to achieve innovation on a day-to-day basis, and you have interest in any of the companies included in our database, we encourage you to contact our prefectural office. It is our hope that this database can be actively utilized as a tool to expand business opportunities.

Industry of Ehime Prefecture

Ehime Prefecture has an estimated population of approx. 1,343,000, and gross prefectural product (nominal) accounts for approx. 49,155 million dollars (2015), with an approx. 41,627 million dollars (2017) total value for manufactured goods shipped.

The prefecture's industrial structure (based on production output) is, primary industry 1.9%, secondary industry 29%, and tertiary industry 68.5%.

In addition, the industry of nonferrous metals has the highest product shipment value (17.5%) and paper/pulp (13.7%), petroleum and coal (13.7%), and shipbuilding/other transport-related machinery (9.6%) follow.

Ehime is a unique industrial prefecture in that it accounts for 45.8% of the total shipment value of manufactured goods in Shikoku.

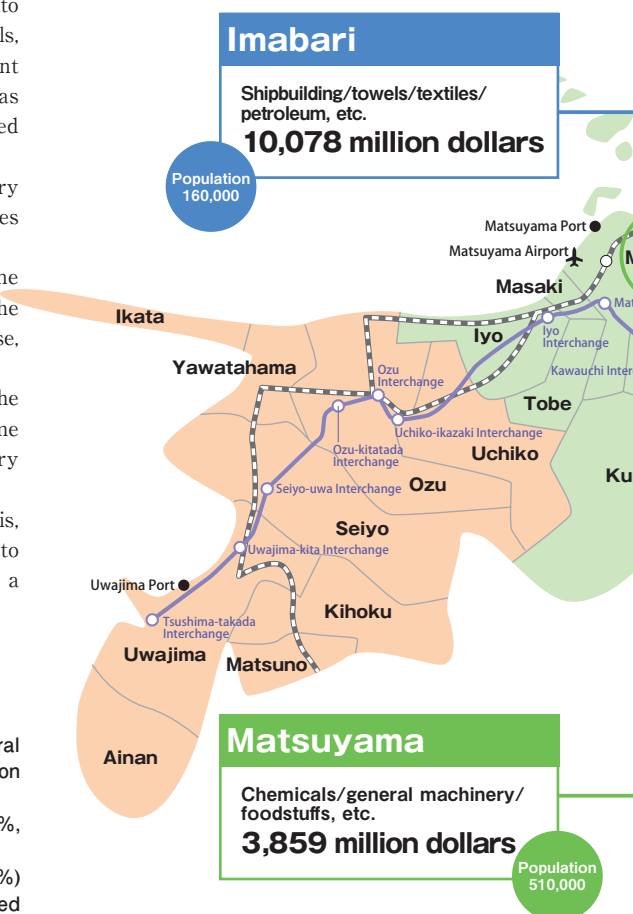

Component ratio of four prefectures in Shikoku

Population of each prefecture

Regional Concentrations of Industry

Toyo area

Shikokuchuo / Niihama/ Saijo

Shikokuchuo City is a distinguished paper manufacturing center catering to everything from traditional mizuhiki paper to advanced state-of-the-art fields, and home to companies such as the Daio Paper Corporation, operating a large plant for paper and pulp. The city also boasts the greatest value for manufactured goods shipped in Japan for the paper manufacturing and processing industry. Along with papermakers, a large number of paper processing companies such as Unicharm Corporation and Lintec Corporation are located in Shikokuchuo, making for wide-ranging production capabilities covering any type of paper product aside from stamps and banknotes.

Following the opening of the Besshi copper mine in the Edo Period (1600-1868), Niihama City eventually became known as Sumitomo Group's "corporate castle town," home to Sumitomo Metal Mining Co., Ltd., Sumitomo Chemical Co., Ltd. and Sumitomo Heavy Industries, Ltd. The city's industrial area is a concentration of small and medium-sized industrial machine companies that take advantage of the group's high-class technology, operating in nonferrous metals, chemicals and other such fields. There is also a company producing equipment of an asteroid people(A substance is extracted).

Saijo City has become one of the most active areas for industrial location. The cluster of major manufacturers' facilities located here includes Nisshin Steel Co., Ltd. Toyo Works, which is a development and manufacturing base for highly corrosion-resistant coated steel; The Saijo Factory of Renesas Semiconductor Manufacturing, which manufactures system LSI products and other products; The Saijo Factory of Kuraray Co., Ltd., a leading company in LCD polarizer films; the Asahi Breweries Co., Ltd. Shikoku Brewery; and others.

Toyo area

Imabari area

The country's largest towel production area, accounting for more than 50% of the domestic share, and home to the Imabari towel brand. Also a large number of companies involved in clothing and textile companies are concentrated in this area. Furthermore, the area has been involved in shipping since ancient times thanks to its roots as an important marine transport hub: with shipbuilding companies such as Imabari Shipbuilding Co., Ltd. and Shin Kurushima Dockyard Co., Ltd., as well as BEMAC Co., Ltd. which undertakes shipbuilding-related processing and assembly, the Imabari area has developed into one of Japan's leading shipbuilding industry regions, accounting for approx. 21% of new ships manufactured domestically. There is also a wide variety of other production operations in the region, including local industries making use of regional resources to manufacture building stone, roof tiles, lacquer ware and other products, as well as major food flavoring maker Nihon Shokken Holdings Co., Ltd., high-quality petroleum product manufacturer Taiyo Oil Co.,Ltd.

Chuyo area

The Chuyo area centering on Matsuyama

Chuyo region has approx. 40% of the prefectural population and many mainstay facilities of governments are located especially in Matsuyama, the capital of Ehime. There is also known as famous sightseeing spot including Dogo Hot Springs, Matsuyama Castle. Furthermore, the tertiary industries such as commerce, tourism and service industry are accumulated there.

Along with the Toyo Region, the Chuyo Region is a leading industrial zone of the prefecture. A number of top-class corporations, as well as medium and small-sized corporations with advanced technical capabilities that support them, can be found here: These include Toray's Industries, Inc.'s Ehime Plant, a supply base for carbon fibers used in aircraft and bicycles for sports chemical manufacturers such as Teijin Limited Matsuyama Plant, which produces high-strength aramid fibers; large-scale machine maker Iseki & Co., Ltd., a manufacturer of agricultural equipment; Miura Co., Ltd., a major producer of boilers that is actively expanding into environment-related fields; healthcare and medical device maker PHC Co., Ltd.; processed foods companies Yamaki Co., Ltd. and Marutomo Co., Ltd., which produce dried bonito flakes and other products; and other companies, including a majority of the information service companies in the prefecture.

Nanyo area

The Nanyo area centering on Yawatahama, Ozu, and Uwajima

This region, which centers mostly on primary-sector industry, is known not only as being one of the few citrus fruit production centers in Japan, but also for its aquaculture industry which provides abundant yellowtail, pearl and red sea bream: prefectural fish.

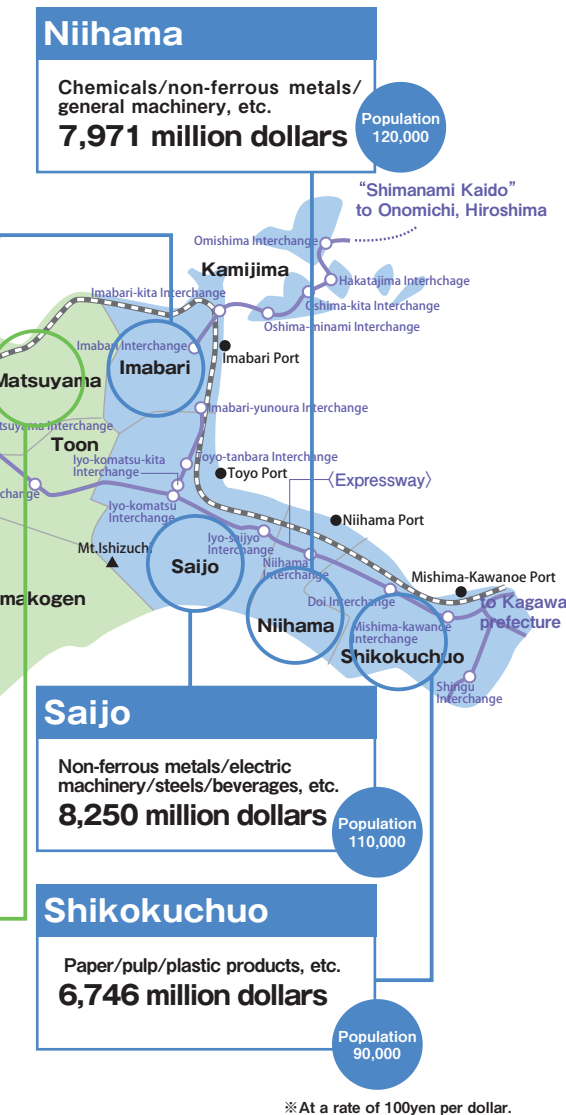

Yawatahama City area is home to fish paste products manufacturers since long time ago. In addition, a ham and sausages maker, Seinan Kaihatsu Co., Ltd., which developed the first fish sausages in Japan, is located.

Ozu City is home to a number of companies with strong planning and development capabilities that are active in unique fields, including Senmi Ekisu Co., Ltd., a company that makes masterful use of biotechnology to produce natural flavor extracts, foods with specific health-preserving functions and other products; Marusan Industry Co., Ltd., a company that manufactures absorbent cotton products for medical use, cosmetic cotton pads and other sanitary materials and products; Aitec Corporation, the country's leading manufacturer of toothbrushes for business purpose in hotels.

In Uwajima City, there are a lot of Marine product processing companies. They take advantage of its rich aquatic resources, and the area is also home to Kaneko Co., Ltd., a party cracker manufacturer whose products boast the top market share in Japan.

Toyo Co., Ltd.

"SUGOWAZA"
Made in Japan

Textiles

Protective clothing that provides safety and comfort

This company specializes in the manufacture and sale of nonflammable garments and safety devices, including protective clothing and protective equipment made with aramid synthetic fibers and materials. They develop lightweight clothing products that are easy to work in and designed well, taking advantage of the aramid fibers' inherent flame resistance and high strength.

Its superior safety performance is pursued through repeated product usage testing, including evaluation for various product functions such as strength and heat resistance. Customized manufacturing revolving around specific material selection and combinations and other minute factors can be performed, and even small-lot production is possible.

Toyo Paper Mfg. Co., Ltd.

TM Tomioka KK

Textiles

Masters of shade: Cooling the world using eco-tents

"Pyramid Suzu Shade" eco-tents (suzu means "cool" in Japanese) create shade in the space above the roof, reducing temperature increases in the building interior. Fluorine-coated fabric is used with breathable polyester mesh material to make this product, and proprietary pyramid-shaped fasteners developed by the company fix the product securely to the roof so winds won't disturb its positioning.

Corporate names and mascot characters can be printed on the product surface, and the roof can even be used as advertising space. In addition, rolling screens made from the same material can be attached to walls and windows.

Ishikawa Tent Co. Ltd.

Textiles

Ecological measures using shade from roof-mounted shades

This company's roof shades, designed for quick attachment to folded-plate roofing using specialized brackets, not only offer lowered costs, they also achieve outstanding results in terms of thermal insulation.

Sturdy polyethylene mesh sheet blocks sunlight off and makes the shade on the roof. The air sandwiched between the layers reduces thermal conductance and suppresses temperature increases in the roof. As a result, it inhibits rising indoor temperature, power consumption from air conditioning during the summer and thus it is possible to reduce the environmental impacts.

Ishikawa Tent Co. Ltd.

Craft Center Oriza Inc.

Textiles

The story of a loom: early-20th-century retro as new-style modern

The owner of Oriza researched and restored old-fashioned looms, which included restoration of an old-fashioned Toyota-type fixed-width loom that was previously used during the early Showa Period (early 20th

century). This powered loom was made by inventor and industrialist Sakichi Toyoda in the early Showa Period, and there are very few such looms in operation today, making it a rare piece of machinery.

Oriza uses this loom to manufacture products and then sells them, while also developing new and original loom technology. The company received

the Minister of Economy, Trade and Industry's Prize at the 3rd Manufacturing Awards for its tate-yoko voroke moji-ori ("up-down staggered leno weave") weaving technique, a rarity anywhere in the world.

Craft Center Oriza Inc.

Nishi Senkoh Co., Ltd.

Textiles

Proprietary technology in pursuit of environmental-friendly operations and value-added dyeing

Operating based on the motto "we will try dyeing anything that can be dyed," the company dyes towels and textile products in general. Through early implementation of a mass production system using natural dyes, use of natural orange extractives in precision processing that removes impurities from cotton thread, and other such measures, Nishi Senkoh has received high praise as an environmentally friendly company.

In addition, the company has been certified under the Global Organic Textile Standard (GOTS). The company has received much attention for its production of value-added products using inkjet and a wide range of tenter dyeing processes, use of platinum nanoparticles (which help eliminate bacteria and odors) in processing, and other approaches.

Founded: Oct. 1967 Capital: 10 M yen President: Toichi Oda Employees: 40 Businesses: Towels in general, customizable towels, embroider/printed towels Revenue: Non-disclosure

A weaving technique named "Bishamon" is a groundbreaking method which effectively uses computers to interweave the pattern of a picture of a celebrity or character into towels. The patented technique is still very unique. Because of their practicality as towels, the demand for them as promotional tools or commemorative gifts is ever-increasing.

In addition, the "Yumeorihime" technique is also much in demand, as it can interweave a name or design into towels. This company institutes strict production control systems which include keeping constant stock of more than 100 colors of yarn, which enables it to offer products at low prices with quick delivery.

Dream towels interweaved with 90 years of history

Fujitaka has occupied a worldwide position of leadership for approximately 90 years thanks to advance technical and creative planning capabilities. This company, which boasts one of the largest domestic shipping volumes for Japanese-produced towels, uses Gobelins tapestry FX technology to offer full-pattern designs for even 190-cm-wide towels. Furthermore, use of five-color weaving enables extraordinary expressiveness for various types of patterns. Using soft, water-absorbent F90 cotton towel threads, the "F90 COLOR COLLECTION" with its high variety of thread colors has aroused widespread interest.

Dyeing and weaving patterns to create an image of the future

The "collaborative unit" co-op Ryo ka was formed in 2008 through the union of the three specialized corporations in different fields who support the next generation in Imabari City: Uewaki Co., Ltd., who undertakes textile weaving; NISHI SENKOH Co., Ltd., who handles dyeing; and SUWA MONSHOH Ltd., who is in charge of rush weaving. Ryo ka is the first organization in the world to undertake high-precision, ultra-wide jacquard weaving, and during the same year (2011) it received the Industrial Promotion Contribution Award. Moving forward, the organization aims to further establish the Ryo ka brand—their challenges have only just begun.

Printing technology and twisting machines for a new kind of individuality

This company provides high-quality bath towels, face towels and other towel products based on the concept "towels directly touch our skin, so they should be made as safe as possible." One of the company's greatest strengths is its twisting machines, which can twist two different strands of thread together. By using these machines, which are rarely seen anywhere in the world, towels with lame and other unique towel products are continually made available. Full-color photo-quality printing is available at the company's cutting-edge printing plant. Furthermore, pile weave can be produced at the same time that photo-quality printing is carried out through the use of computer programs, vastly expanding possibilities in towel production.

Offices: Tokyo, Hiroshima
Revenue: Non-disclosure

Cleaner rivers through advanced wastepaper processing

This company has implemented a wastepaper recycling system to replace the conventional method, which uses large amounts of chemicals and contaminates water. In this improved system, friction between paper fibers is utilized and ink is removed from the paper through adhesion to bubbles. In addition, they have developed paper machines that consume very little energy, and environmentally friendly toilet paper production process that greatly reduces COD (chemical oxygen demand) per ton of wastepaper as well as electricity and fuel consumption. The company has received high reputations for its world-leading wastepaper processing technology.

Izumi Paper Co., Ltd.

Founded: July 2008 Capital: 3 M yen
Representative: Hiroyuki Saito
Employees: 3 Businesses: Manufacture and sale of processed goods made from original Washi (Japanese paper)
Revenue: Non-disclosure

Handmade Japanese paper is one of the traditional industries that Ikazaki has maintained for 350 years. The company manufactures and sells wallpaper, accessory items and other products that combine Japanese papermaking with creative gilding design. Ikazaki learned its gilding techniques directly from Gabor Ulveczki, a designer residing in Paris who also advises the company on its wallpaper product development and other areas. In addition, Ikazaki is registered as a company that supports the cultivation of Japanese brands, and endeavors to create original products using Japanese traditional paper.

Eco-friendly paper packages

TAMU manufactures sophisticated, high-end punching machines for operation by skilled workers. This company also produces high-end paper cartons made manually for better design and durability. The main products are cylindrical paper cartons whose strength increases when paper is interlocked together. This, along with other sophisticated techniques, enhances TAMU's reputation as a skilled manufacturer.

TAMU responds flexibly to their customers' needs, developing distinctive and highly-durable products. Through durability tests conducted at Ehime Industrial Research Institute, TAMU's products are proven to be resistant to pressure and frozen storage.

Shimizu Co., Ltd.

Pulp/paper/
paper products

Livening up events with bright and colorful decorative tapes

One of only a few such companies in Japan, Shimizu is a specialized producer and seller of decorative tapes and paper string used to liven up important soccer matches, baseball games and other sporting events as well as ship-launching ceremonies and a wide range of other such occasions. Their products account for 80% of the domestic market share.

Shimizu offers Hinotori Kanko Tape, which is made with environmentally friendly materials that readily decompose and return to the earth while ensuring reliable-quality color expression and wide color selection, and Venus Tape, a film-based product widely used as decorations at Tanabata (the Japanese "Star Festival") celebrations and school field days along with other such events. The company also makes and sells Sunshine Tape, Rainbow Tape, various paper strings, and a wide array of other products.

Creative power to bring about change through paper

This company provides medical care paper and wet care paper products with unparalleled levels of safety and quality that comply with numerous strict standards and have earned high praise by users in the medical and nursing care industry, food industry, precision manufacturing industry and others.

All employees are sharing the guiding concept of "contributing to society through creative power to provide solid value to end users" to achieve product specifications that are rarely obtained in conventional products. Value is also important in less tangible areas such as sales and distribution, and management systems such as SCM and VPN—which are rarely utilized by manufacturers—have been introduced.

Daio Paper Corporation

Pulp/paper/
paper products

Advantageous resource-saving improvements at a comprehensive paper manufacturer

"Elleair + Water" tissue paper was created in response to customer dissatisfaction about the feel of

tissues on their skin. Moisturizing ingredients are mixed by using manufacturing technology not found anywhere else in the world to achieve a 170% moisture content improvement for each sheet (compared with company's standard product), resulting in a tissue that feels smooth to the touch and is gentle on the skin.

The company's thin, lightweight, resource-saving PPC paper is made by maintaining the same paper quality while reducing its weight by approximately 14% and slimming it down 13% (percentages are comparisons with company's standard product), for paper so light it's shocking. This helps reducing CO2 emissions during shipping and also contributes in other areas.

Revenue: 330 M yen (as of Apr. 2016)

This company has the top market share in Japan for colored kyohana-gami, decorative paper used to make artificial flowers, which is an essential product for school events, the Tanabata star festival and other events throughout the country. Former products lacked resilience and tended to fade colors quickly. The company has been improved products through various research projects, using specialized blades for refiners and fade-resistant dyes.

Because the company is most sensitive when it comes to dyeing, special high-quality dyes are used in amounts minutely adjusted depending on weather conditions in order to maintain high color fastness to light and ensure standardized coloring results for all products manufactured. The company also offers a uniquely wide selection of color variations.

Tea bags combining high quality with the strength of the original

In 1983, this company began sales of the world's first tea bags. As a common household item, this product has undergone continuing improvements and maintains the top market share to this day. It is used widely even outside of Japan (mainly for black tea). No suitable non woven material was available when development of this product was started, so the company spent three years developing its tea bags based on the following three conditions: (1) has ideal thinness and sufficient strength; (2) won't cause harm as a food product item and has no taste or odor; and (3) doesn't use bleach or any other such chemical. All production processes are carried out using machines designed by the company itself, and dimensions and other such factors are strictly controlled according to company self-imposed standards.

Miki Tokusyu Paper Mfg. Co., Ltd.

Processing numerous kinds of fibers into sheets formed through specialized technologies

Paper is generally made from wood pulp. However, this company does not limit itself to that basic ingredient, instead breaking up all kinds of natural ingredients (Oriental paper-bush, Manila hemp, etc.) and synthetic fibers in water and forming them into sheets to create a wide variety of specialized papers.

As a result, the company has received the National Invention Award for its research and development of specialized paper, the Fujiwara Award from the Japan Technical Association of the Pulp and Paper Industry, the Local Invention Encouragement Award, the First Science and Technology Agency Director General's Award and numerous other honors. The company now strives to become a leading provider in the fields of high performance papers and wet type nonwoven fabrics.

Marusan Paper launched its business in 1919 and became a manufacturer of handmade Japanese paper. Their current main business is the production by order of base paper for processed paper goods. In addition, the extensive product lines include sliding-screen paper, Japanese calligraphy paper, oil-resistant paper, rayon laminated paper, and specialty paper.

Now, Marusan Paper has developed flame-resistant paper. It is highly resistant to flame and has no detectable amounts of hazardous substances. Since the paper is produced using only boric acid, it is simply carbonized—not burned—in flames. The technology can also be applied to cloth or yarn. This product is currently attracting much attention because of its low cost and eco-friendliness.

Daruma Seishisho YK

Planting lawn on rice-paddy levees to mitigate weed-removal labor requirements

Daruma Seishisho has achieved a weed-control method wherein centipede grass seeds are planted via air-blasting onto the embankments of weed-infested levees (ridges of earth between rice paddies), which results in lawn growth and reduces weeding-related labor demands. Standard air-blasted seed planting shows limited success as a countermeasure on levee surfaces where weeds are already in abundance; Daruma Seishisho's approach, on the other hand, uses papermaking stock consisting of repurposed wood waste generated during the production of Imabari towels in a unique agent that helps seeds take root, thus overcoming problems related to poor root-taking efficiency seen with standard air-blasting. Because this root-taking agent is made from natural ingredients, it decays over time after planting, leaving no residue behind in the soil. It was patented in 2011 and has seen widespread use, particularly in western Japan.

Artificial Wood with Water Resistance and Low Secular Change

The artificial "Ashera Wood" is formed by firmly binding resin and industrial waste that is fly ash generated in Saijyo Thermal Power Plant. The wood has much greater water resistance, flexural modulus, and strength compared to conventional recycled wood. Even in severe natural environments outside, it can maintain strength and beauty for a long time, and is a material that is best suited for parks, roofs of buildings, public spaces, and the like. There are three color variations available, and the wood is easy to work with and can be used for various types of deck spaces.

Advances in the science behind printer paper

The company president, a true engineer who worked in the product development department of a major manufacturer before moving on to graduate-level studies in mechanical engineering at Stanford University, has developed a large number of groundbreaking office-automation paper products. This president's company is also responsible for a significant number of patents in Japan and abroad. The secret to this company's competitive strength lies in its use of such technical strength combined with tangible advances in order to meet diversifying needs, which stands in stark contrast to the worldwide trend toward rationalization. Responding with precision to minor changes in printer technology and other such approaches have earned the company trust and repeat customers.

TAKECHI Co., Ltd.

Leveraging proprietary technology to develop precision rubber parts

Takechi aims to expand the potential of rubber by manufacturing precision rubber parts that can be used in a variety of industrial fields. In particular, the company has one of the top domestic market shares in gaskets for electric refrigerators. They were the first to develop building gaskets for outer-wall use, and their products are currently used in the Roppongi Hills Building, Tokyo Dome, and even skyscrapers located outside of Japan. In addition to high-performance precision rubber products, Takechi manufactures high-performance plastic parts in an effort to serve as a provider of fine mechanical engineering rubbers and plastics. In particular, the company's plastic magnets, which are used in in-car rotation sensors, boast a high market share due to the highly evaluated forming dimensions and the accuracy of magnetization.

Justin Co., Ltd.

Configuring Systems that Can Respond to Emergency Situations

Orders related to our core business, packing / gasket manufacturing, can be shipped on the same day if it is made by 5 pm. All of our computers have CAD installed, and our employees form a data network connecting all of our processing machines.

We are well equipped with a mold manufacturing machine, single-shot press, continuous press, automatic cutter, and waterjet cutter, so we can deliver single items to large batches. We have a processing system and delivery system that can manufacture items in 15 minutes allowing uninterrupted business for our customers.

NIHON-DISK IND. CO.,

Beautiful cuts with thin grinding wheels

NIHON-DISK IND. handles thin grinding wheels which can cut pipes made from difficult-to-machine metals (iron, stainless steel, tungsten, molybdenum, inconel, etc.), solid wood and other materials with precision while maintaining a smooth cutting surface. The company can also cut thin items with grinding wheels, which is essential in the manufacture of injection needles, industrial piping, electronic parts, etc. Furthermore, the company has also developed an automated precision cutting machine to enable accurate cutting of metal on a mass-production scale. This device has become indispensable in the manufacture of various types of industrial piping, injection needles and other products.

TAISHIN Co., Ltd

Light, easy, and earthquake-resistant roof tile construction method

eeBOX, Earthquake-resistant Box Ridge, has been developed by TAISHIN. TAISHIN has tackled the challenges of earthquake-resistant methods of roofing for Japanese architecture since the Great Hanshin-Awaji Earthquake. Strength and durability have been ensured by removing soil and daub used in the conventional ridge and fixing the tiles directly with screws on the wooden or resin box. More than 30 earthquake-resistant box ridges of eeBOX, which we developed after pursuing the low-cost and easy construction method, were constructed after the Kumamoto Earthquake in 2016. It has gathered attention as an indispensable technique in an earthquake-prone country, Japan.

Protecting your living environment through wall-finishing materials

This integrated wall-finishing material manufacturer handles everything from development to sales for exterior and interior building finishing materials. The company's high-quality, unique wall-finishing materials which is invented by the research and development department, were created in following with the company philosophy, "beautiful and peaceful spaces where people can live and be at peace."

The diatomite "Siltouch" wall finish coating is made without volatile organic solvents, and helps control room humidity and temperature and adsorbs foul odors and toxic substances while providing countermeasures against sick building syndrome and other such problems. The company's products have garnered high praise in Japan and abroad for their high quality and design appeal.

Highest production volume in Shikoku

Among products manufactured by this company, 80% are important safety-related parts used in reducers, actuators and other portions of construction equipment, agricultural machinery, etc. These high-precision, sturdy products made using tough, processed materials are highly acclaimed for their safeness, reliability, and durability.

The company uses its core molding technology to produce thin or thick products, even in difficult shapes, with a maximum metal mold size of 900 x 600 mm. Improved green sand casting technology makes mass production possible, and stable manufacturing of high-quality products is achieved by utilizing a medium-volume production system for medium-sized components.

Co-op for Ehime Pig Iron and Casting Industrial Complex

Steel
industry

A lineup of richly unique casting products

The companies belonging to this organization produce a variety of casting products ranging from large items to mass production of small items, and they are capable of accurately introducing customers to suitable products and technologies in response to any inquiry. The organization prepares fundamental elements for manufacturing operations, such as power receiving equipment, water supply and testing equipment for compressor facilities, which reduces each company's costs.

The organization has business dealings with major manufacturers all over Japan, and the complex as a whole accounts for 70% of Shikoku's casting production volume. Quality control is carried out using a two-part system, which involves elemental analysis of molten metal and inspection of finished products.

Ehime Boring Kiko Co., Ltd.

Metal products

Following their dreams through boring for half of a century

Boring as a part of shipbuilding operations requires extremely high precision, and Ehime Boring Kiko works on ship stern sections, which determine the vessel's propulsion and direction of movement. During bore cutting for propeller shafts, steering shafts and other sections, this company's independently developed technologies increase the amount of cutting per turn of the cutting tool by two times compared with standard equipment. In addition, the company also develops and installs groundbreaking controllers that facilitate easy adjustment of cutting tool rotation speed to match boring diameter, materials and conditions. By making use of this equipment as well as know-how cultivated by the company over many years, work time reductions of approximately 30% can be achieved.

Large Drinking Water Storage Tank with Three Functions in One

The drinking water storage tank "Megapot" allows for long-term storage of sanitary water without a maintenance fee. This combines the features of drinking water storage with fireproofing water tank and emergency electric power source features, and can secure safe water for 24 hours 365 days. This is a tower type tank that can be installed compactly, has a simple structure, and can easily intake water. Instead of using chlorine, it uses sunlight and wind to power ultraviolet light that sterilizes the tank. The plug installed in the control board can also supply electricity, so it can be used as an emergency power source. It is a product with high hopes for disaster control.

Enabling trial production of castings without the use of molds

This company provides casting and machine work testing as well as mass production services, and manufactures a wide range of reliable, strong cast iron parts for hydraulic and pneumatic equipment, construction machinery, electric motors, and more. Using cutting-edge casting equipment that is both high-speed and labor-saving, the company operates an integrated production framework in which product material quality is carefully controlled and guaranteed, and all operations up through heat treatment can be performed. Trial casting through rapid prototyping without the need for wood or metal molds can be carried out quickly and with precision. Operations are not limited to cast iron—even copper alloy can be used.

Masterful skills stemming from ideas in pursuit of effortless operations

Suntechno Kuga has developed a range of unique and popular products that mimic the skills of masterful artisans, including a blowfish skin-removal machine, dagger-tooth pike conger (eel) bone chopping machine, blowfish slicing machine for making sashimi, far-infrared low-temperature drying machine, citrus fruit skin remover that removes the fruit's bitter outer peel and peel oils, and others. Their far-infrared low-temperature drying device utilizes electromagnetic (far-infrared) radiation to prevent cell rupturing while increasing the savory flavor of foods and achieving full-bodied results by quickly removing moisture content.

The company's products have received much praise in applications including slicing blowfish for sashimi, removing moisture content from fish, making fruit sauces and so forth.

Extending usable life for machine parts susceptible to rapid deterioration

Sumitomo Heavy Industries Himatex utilizes build-up welding (laser metal deposition) technology to add high-hardness, high-wear-resistance materials to the surfaces of machinery parts used in demanding operating environments. Surface-material powder is melted using laser technology and then solidified to create a new base layer on the component's surface, adding high wear- and corrosion-resistance along with other useful properties.

The company's approach enables deposition of enhancing materials to only the necessary portions of components—even complex-shaped components—making it more cost-effective than the expensive, standard-type application of material over the entire component surface. Moreover, welding strain can be greatly reduced compared with conventional approaches.

When it comes to large-size mechanical parts and ultra-thick plate welding, leave it to Shiozaki!

Shiozaki specializes in the welding of thick plates and manufacturing of large-size parts, and possesses the technology and facilities that enable the processing of large-scale parts of up to 20t. The factory also handles the tundish of ironworks that demands heat-resistance and durability, as well as proton radiation equipment and other parts for state-of-the-art cancer treatment's rotating gantry that requires a high degree of precision and rigidity. Additionally, the factory has acquired a manufacturing license for 30t+30t hoist type cranes, and has the capability to manage the design, on-site assembly, inspection/operation check, and shipping of large-size cranes utilized at large worksites.

Clog-free filters that don't require cleaning

Liquids are injected into these cylindrical filters at acute angles to generate a spiraling liquid film, and the filter is rotated in order to scrape off solid matter adhering to inner surfaces. Jinno Kogyo develops filters that don't require backwashing and can sustain stable, high-quality filtering operations over long periods of time.

Because backwashing operations are not necessary, the device itself is compact, maintenance is easy, and nozzle specifications such as the number of nozzles and nozzle sizes can be altered freely. These products can be utilized in a wide range of different fields, including

water treatment, food products, papermaking and metalworking.

Products that enrich lifestyles and improve conveniences

This company provides a wide range of household and environmental products designed in pursuit of user-friendliness and safety, with features such as sturdy columnar design, lightweight and quiet top-hinge linked sliding doors, and aluminum rails that facilitate smooth opening and closing. Sliding bicycle-rack storage devices are made from rust-resistant ZAM material, and the racks slide left and right to facilitate parking and removal of bicycles as well as high storage efficiency. The company boasts excellent 3D processing technology for thin steel sheets, and can provide high-quality products free of deformation.

Technology to overcome the difficult task of cutting pure nickel

This company has unique technology that enables grinding of hard to cut materials with high-corrosion and heat-resistance characteristics, such as inconel, tungsten etc. using general-purpose equipment. That is why the company is the world's only mass producer of pure-nickel parts for semiconductor manufacturing machinery.

Utilizing its unique know-how with long time experience of dealing hard to cut materials, the company regrind multi purpose blades to develop special blades in-house. Thanks to its advanced cutting technology, the company is highly skilled at cutting thin items and processing in minute details. Facilities are fully equipped with processing machinery capable of performing difficult multi-face machining simultaneously, among other equipment.

TAKAYOSHI THE INDUSTRIAL PLACE

Metal
products

The best of the best when it comes to machine tool operation

This company performs precision machining for small hydraulic parts used in construction and agricultural equipment, and performs final finishing work mainly by hand. They respond to small-quantity, high-variety production orders, provide integrated product manufacturing services covering everything from part machining to welding, and can deliver completed products in a short time. For large lot numbers, equipment with powerful loader specifications can be introduced to enable response to a wide variety of orders. In addition, the company provides guidance on machine tool installation and maintenance operations as well as other general services related to machine tools.

Facilities enabling to process large products

At the company's processing facilities, which are divided into two plants, it manufactures dust collectors that remove dioxins from flue gas using mainly plasma and dust collection filters.

The facilities feature advanced plate work fabrication and welding capabilities and are equipped to handle products that are up to 10 m wide by 10 m tall. Furthermore, their production system enables integrated manufacturing encompassing everything from material cutting to molding, assembly, and shipment. Because the head office plant directly adjoins the port, the company can handle loading operations for large products. The company has even manufactured and delivered a screw coaster to the Lotte World amusement park in South Korea (see upper photo).

Metal
products

Technologies that bring ideas to life

This company excels in precision sheet metal working. For press brake machining of hoppers,

the company carries out press working while achieving a smooth surface radius curvature and a high roundness. Aside from non-specification reducers and other conical taper-rolled products, they earn an excellent reputation for their precision bending operations used to round off corners on various polygonal shapes.

Takasuka handles a wide range of product sizes, including items with high taper rates that are not possible to achieve using standard roller mills; small-internal-diameter items the same size as the palm of the hand; and even large-scale, thick-walled items with diameters surpassing 2 meters. The company meets customer needs in numerous ways, including development starting with 3D CAM modeling, and even completion of welding in more recent orders.

Aluminum Casting Pot with Even Heating and Deformation Resistance

Aluminum pots produced through aluminum gravity casting are regarded highly as a cooking utensil with high added value due to its low uneven heating and resistance to deformation. This is made possible through pouring aluminum alloys one at a time into the mold using gravity, which produces aluminum pots with bases that have even crystal structures.

Our electromagnetic cooker supported product (Patent No. 3890336) includes our uniquely developed magnetic stainless disc on the bottom surface joined by monobloc casting; this prevents deformation at the bottom surface and achieves efficient heating and high durability. The product supports any kind of heat sources in addition to electromagnetic cookers.

Tastem Co., Ltd.

Metal products

Highly polished technology including comprehensive thin sheet metal facilities

This metalworking specialist company takes pride in its achievements for about 50 years. The company is top-class in Shikoku in terms of cutting-edge facilities, which include a high-precision laser processing machine, a press break capable of high-speed processing, an NCT turret punch press, and more. Ironworks section's forte is the manufacture of operator's cabs for cranes through masterful use of thin sheet metal processing techniques—a skill that no other company can match.

In the Building section, the earthquake-proof door which can be opened and closed also in case of a massive earthquake was developed, and it acquired the patent.

The company continues to lead the industry through an integrated manufacturing process that includes everything from design to development and programming.

Implementing a long lasting belt conveyor roller

Touwa is the only steel flange maker in Shikoku that uses integrated manufacturing to produce various types of flanges. Working together with LP gas tank maker Hagio High Pressure Containers Co., Ltd., TOUWA KOGYO has developed an innovatively constructed, long lasting, low cost conveyor roller.

Belt conveyors used along the coast generally have shorter lifespans due to salt corrosion or particulates from freight. The successful development of this new product has increased airtightness and prevents foreign substances from settling in, allowing for longer use of the roller.

Nishioka Iron Works Co., Ltd.

Metal products

A thin sheet metal without distortions with fiber laser technology

Due to its energy efficiency, high-output capability, excellent beam quality, and a high level of stability, the fiber laser welding technology has become the golden standard of laser processing. Although this technology is often employed in the field of sheet metal precision processing, Nishioka has applied it to the welding of general can products with a primary focus on large scale sheet metal processing. A system equipped with a 4m wheeled robot enables the handling of numerous types of products in a variety of quantities. With the welding's low distortion and deep penetration and the welding available for reflective materials, Nishioka's technology has the potential to radically transform the common practice of the field of sheet metal processing.

Water Jet-Hydraulic cutting technology that can cut through anything

Water-cutting is a technology that cuts material with high-pressurized water. This allows Horie to cut complex mixed-material compounds including composites and laminates, as well as aluminum, copper, titanium, timber, stainless steel, rubber, and ceramic. Since this cutting generates very little heat, it is not only able to cut objects into complex shapes but also to minimize their transformation, including discoloration and hardening. Horie can cut objects up to 1219mm by 2400mm and accepts small cutting/processing orders (even single pieces), too.

Bone harvester developed by a collaboration between medicine and engineering has made bone harvesting easy

KM Bone Harvester is manual equipment used for bone transplantation in orthopedic operations, which has been developed collaboratively with clinical doctors based on our original precision component processing technology. Compared to the conventional equipment which uses the manual rotary cutting method, our newly-developed one adopts the hit-in method. It is possible to harvest a nicely shaped bone pillar just by cutting the skin 2-cm deep in the iliac region and hitting it. It takes only a few minutes to harvest a piece of bone and therefore operation time is shortened. Thus, it is highly acclaimed because it contributes to the reduction of doctors' labor.

Employees: 10 Businesses: Production of agents to remove mercury and hydrogen sulfide from petroleum products, overseas sales of Ehime Prefecture products Offices/Facilities: Research center (in Ehime University), and offices in Tokyo, New York and Taiwan Revenue: 100 M yen (as of Mar. 2017)

Through roughly 20 years of continual, joint research with Ehime University, IH Technology has developed desulfurization equipment for gasoline base materials, and mercury-removal catalysts and equipment for petroleum products, industrial wastewater, etc. These enable reduction of ultratrace amounts of mercury in petroleum products to 0 ppb or less, and of ultratrace amounts of hydrogen sulfide to 0 ppm or less, contributing to higher quality products and lower environmental impact. The company's technologies are already being used by numerous petroleum companies both in Japan and abroad, where they exhibit steady and satisfactory results. In recent years, IH Technology has also proposed related measures for post-processing of mercury and used mercury-removal agents in accordance with the 2013 Minamata Convention on Mercury.

Saving energy while efficiently processing highly-concentrated waste water

SUPER Depcer, a wastewater treatment equipment that uses anaerobic microorganisms, provides an energy-efficient, cost-efficient, and space-saving treatment for highly-concentrated waste water which is difficult to process using conventional methods. Also, methane gas obtained from the treatment process can be used as fuel for in-house power generation, which helps to reduce fuel cost. Not only is excess sludge reduced substantially, but also the equipment's power consumption is 1/10 of that of conventional methods. Aiken Kakoki K.K. is currently expanding its business not just domestically but also internationally. With the Vietnam office as a base, the company is looking to expand its business to other developing nations with a central focus on countries in ASEAN.

Establishment of a new type of therapy

The **AMTC200 electric cautery device for animals** is new treatment using heat. It minimizes the burden on animals being treated and can be used in conjunction with other types of treatment. Its merits include a minimally invasive approach (compared with surgery) and a higher QOL (quality of life) for the animal being treated. This device has been successfully used in approximately 200 different treatment result, including fibrous histiocytomas, hemangiopericytomas and perianal tumors.

Thanks to this product, users can anticipate a higher quality of life for their pets.

Technology to mitigate caregivers' labor

Iura launched their business as a machine parts processing company in 1973. Then the founder developed a bed for his bedridden father, which enables the sleeper to roll over and mitigates the labor of the caregiver. Beginning with this invention, Iura has put out many unique health-related products into the market for the disabled or aged. These products are used mainly in nursing organizations and hospitals and are highly-rated. For example, their original "self-reliance bed" helps the users avoid bedridden life. Iura keeps striving to develop new products with the intention of mitigating caregivers' labor and improving the welfare of those who receive medical treatment.

New Generation Mowing Machine with Excellent Operability

Riding type mowing machines are for cutting grass at fruit farms and idle farmlands. Atex mowing machines have innovative features such as the "cutting blade cover washing feature" that received the JPO Commissioner Award and the "slide seat feature" that allows the user to move the seat to avoid obstacles and cut tree roots.

We are known for manufacturing products that are user friendly such as adopting front suspension and zigzag spring seats to reduce fatigue during operation.

We also provide value adding options such as the "Branch Fork SET" for collecting branches that were cut.

Reducing waste in manufacturing processes and raw materials

This company specializes in the design and manufacture of molds for various plastic products including food product containers and medical-use products. They utilize a SHI pulp gate system that does not waste any unnecessary materials as part of their resource-efficient hot runner system technology based on more than 20 years of accumulate industry knowledge, putting them a step ahead of other companies. In addition, the company has achieved multiple-color expression for in-mold labeling operations, wherein pre-printed labels are attached during injection molding. This is difficult to achieve in standard systems and greatly reduces manufacturing process times.

Knee orthoses which can ease the pain of walking

Ai Torino's 3D knee orthoses are aimed at easing pain when walking for those who suffer from gonarthrosis, by guiding their bone structure in appropriate directions. The extension of knee orthoses for mild arthritis patients is meant to protect knee joints, by mitigating the pressure to their cartilages. These orthoses expand, contract, or twist partially according to the leg motion of the users and guide their deformed bone structure to approximate the three-dimensional walking movement of healthy individuals.

By modifying the shape of inducing cams, Ai Torino's orthoses can adapt to a wide range of medical conditions. They are light enough to wear without discomfort. The technology of their 3D motion knee orthoses has been patented in 8 countries and is under review for a patent in 144 more countries.

No.1 in the number of field-specific patents resistered!

The agricultural industry plays the important role of providing us with food, and this company manufactures and sells agricultural machinery to improve the efficiency of that industry. The company employs an integrated system encompassing everything from product development to manufacture and sales.

Iseki owns various patented technologies for smart agricultural machine (image below) is the Robot Tractor TJV655R) using ICT and robotics, such as tractor, rice transplanting machine, and combine harvester. Our skills in technology development has a proven track record of being number one for "number of patents published" (until 2016) and "number of patents registered" (starting 2017) in the field of "other special purpose machinery" for 17 consecutive years, and is number one in Japan for patent allowance rate across all industries for six consecutive years.

Environment-and-goods-friendly cranes

Since the development of RH cranes in 1965, this company has been creating cranes on a fully-customized basis, complying with each users' individual requirements as to the nature of the cargo they handle, lifting capacity, operating radius and so on. Their large-size cranes, which are equipped with inverter control for the first time in Japan, have significantly increased the efficiency of cargo handling. Their "tire-mounted multi-purpose large cranes" can move freely on the quay with the tires run by a driving engine and thus expand the possibilities of cargo handling. Their automated device to open and close a pit cover has been attracting attention as well.

OKAME SEISAKUSHO Co., Ltd.

General machinery

The "Peach System Line" production system is the first of its kind in Japan, designed to meet diversifying customer needs. By combining new molding machines with mold storage facilities, manufacturing operation stoppages when switching between small-lot production types are completely eliminated. Furthermore, by automating preparatory processes, the difficult challenge of achieving short delivery times, high product quality and low costs can be overcome. Mold numbers, mold thickness, pouring gate positioning, squeeze pressure, material properties, mold conditions and other parameters can be entered according to necessary molding requirements for that day's operations using an office-based computer.

High-quality, small-lot production that enables lower costs

The largest share of the market: The trend of the times is in their favor

Located in the marine city of Imabari, this company enjoys the largest share of the Japanese market related to air conditioners, freezers, and elevators for ships. Based on their flexible abilities to take charge of every step, i.e. acceptance of order, production and engineering, and the global technological abilities, they can meet the various needs of their customers.

In an effort to become a more eco-friendly manufacturer, this company has developed an MGO cooling system (low-sulfur fuel cooling system) to meet stringent SOx emission controls. They are foraying into the field of passenger vessels and have supplied pre-fabricated refrigerating/freezing devices to the Diamond Princess and Sapphire Princess, the largest passenger vessels ever built in Japan. This is the only company in Asia to enter global passenger vessel projects, promising a comfortable cruising experience to passengers sailing all over the world.

machinery

Greatly Reduced Time for Obtaining Precision in Metal Bar Cutting

The manual digital measuring device "Digi Pit" was born as a reaction to feedback from metal bar cutting sites such as: "a tape measure cannot guarantee precision," "the scribing takes too long," and "NC machines cost too much." By simply attaching it to a metal saw, anyone can use it easily, and the cutting precision and work efficiency improves greatly. By simply sliding a measurement mechanism with a digital display, this product can be adjusted at the 0.1 mm level. This device is an innovative product that supports today's manufacturing sites required to produce small quantities of various products.

Immediate automatic protein synthesis technology

Every aspect of life activity is realized by the work of protein, which plays a main role even in the function of human intellect or emotion. In 2003, the sequencing of the human genome was accomplished, and as a result, the base sequences of many protein genes have been deciphered. However, there remain many proteins whose functions haven't been clarified yet. Similarly, the analysis of protein networks is said to be vital for future drug discovery and disease diagnosis. This company's cell-free wheat germ synthesis technology can enable automatic, yet comprehensive synthesis of these proteins.

Revenue: Non-disclosure

This company uses technologies and products that reduce the burden on the environment by sorting out mixed plastics that have not been utilized efficiently until now with great precision (99% or higher) and utilizing wind sifters to promote reuse, utilizing processing equipment that enables disposal of used paper diapers as general waste, utilizing equipment that recovers industrial waste as economical solid fuel with a high calorific value, etc.

The company uses its technologies in various fields, including recycling, biomass utilization, air and water purification, energy conservation and others.

Daisho Tekkosho Co., LTD

General
machinery

Our sheet product manufacturing lines are comprehensive

Daisho Tekkosho boasts the greatest number of unit sales in Japan for specialized paper manufacturing equipment. The company employs advanced technology in all areas from design to production, which is put to good use in the production of non-woven fabrics, film and other paper products made with ultra-thin papermaking materials. Inclined wires and other types of manufacturing equipment support high quality and reliability in all production processes while satisfying customer needs, for stable production of top-quality products.

In 2008, Daisho Tekkosho received the Good Company Award, which is given to excellent companies in recognition of business operation rationalization, technological development and other such factors.

DAIKI AXIS CO., LTD.

General
machinery

Realize environmentally friendly lifestyles through local production for local consumption of biomass

DAIKI AXIS, the precursor to DAIKI, has taken the lead in developing a number of industry-first products in the field of wastewater treatment, including lightweight yet sturdy FRP (fiber-reinforced plastic) septic tanks.

In 2002, the company achieved commercial application "D-Oil," a biodiesel fuel made with used tempura oil and other oils. Although oil and water are completely different substances, this product was originally conceived based on the idea of recycling used cooking oils in order to protect aquatic environments. Furthermore, the company successfully developed an even higher-quality "D-Oil N" product in 2009.

DAIKI AXIS makes full use of its advanced technologies to cultivate a better future environment for human beings and the earth.

NIPPON CAREER INDUSTRY CO., LTD

General
machinery

A revolutionary slicer that achieves energy-efficient operations

Nippon Career Industry's "Bending Slicer A to Z" was the first to achieve practical implementation of thin slicing of pork loin, pork round and other such meat in the positive temperature range, and it also positions the meat in rows after slicing it in two.

Touch panel controls can be used to line up the appropriate number of slices for each pack, the sliced surfaces are smooth, and waste meat that results in loss is minimized. This groundbreaking slicer improves safety, conserves energy usage, enhances product quality and improves ingredient yield rate.

Daiwa Packaging Systems CO., LTD

General
machinery

Implementing the world's fastest fully-automated carton formers

We handle the design, construction, and sale of carton formers (corrugated cardboard-cover wrapping machines), sealing machines, casers, palletizers. Our high speed horizontal build case maker, which we sell to large beverage producers, can process 60 cases per minute—the fastest in Japan—and it operates 24 hours a day.

Using the knowhow and the production experience we have cultivated over the years, we have actualized the shortest planning time within the industry, from the proposal stage to manufacture and setup stages. We provide reliable products, and our customer base is expanding beyond the food industry to online sales, pharmaceuticals, paper products and more.

SUGO WAZA

FUJIKOSO INC.

General
machinery

Giving shape to dreams and ideas through comprehensive technological strength

In order to meet the needs of customers in a variety of fields, this company handles everything from planning and manufacturing to installation and construction for automated labor-saving devices. They make full use of their strengths in areas including visual recognition and sensor technologies to develop and introduce a wide range of automated production equipment geared especially toward high-precision and/or small-sized parts.

Formerly, the company focused primarily on equipment for consumer appliance, electronic devices, and automotive and electronic component industries. However, they are currently advancing into new industries by utilizing their accumulated know-how, their experience providing products in various fields, and the strengths of their hardware and software design technologies.

MARUYASU Inc.

General
machinery

Unique and innovative technology giving birth to new patents

Pressurized cleaning equipment (SP, MP) can peel off attached scorched resin without causing any damage to the object. Scorched resin or plastic are attached to the screws or dies of the equipment for casting or molding, and cleaning requires a lot of labor. Conventionally, they scraped, scrubbed, or threw hard foreign matter against it for cleaning, only to hurt, scorch further, or mix foreign matter into the product. You can clean the object in this equipment with the cleaning liquid so that it doesn't get damaged and you can finish cleaning in such soft power as wiping with a towel.

MANABE ZOKI CO., LTD

General
machinery

Adoption of inverter control in shipboard deck cranes for the first time worldwide

This company handles the design, manufacture and sales of shipboard deck machinery (winches, cargo cranes and more). They purchase only the materials needed for production and carry out integrated manufacturing, machining, assembly and inspection operations in-house.

In 2001, MANABE ZOKI successfully applied conventional inverter-controlled electric deck machinery technology for the first time in Japan, and by 2012 they had installed this deck machinery on more than 200 ships. Furthermore, in 2009 they adapted their electric deck machinery technology to successfully apply inverter control in an electric-hydraulic cargo crane for the first time worldwide. Moving forward, the company plans to focus their efforts on fully electric cranes.

Hagiokikai Co., Ltd.

General
machinery

"Workmanship" that supports the latest medical treatment with large and high precision devices

Take the example of one long blade with the unusual cutting edge: Using such a product will result in the problem of bending due to the product's own weight.

However, Hagio Kikai shows its true artisanal expertise by taking this into consideration and manufacturing the product with pre-strain built into the design.

We have received high acclaim in the industry for our ability to create precise flat planes on the body of large-sized, malleable steel products, used for cyclotrons, which are used in the latest technology for cancer treatment. We boast of a precision of $30\mu\text{m}$ or 5m for large-sized highly precise processing.

Flexibility through vacuum roll-to-roll processing

This company develops compact and economical sputtering equipment prototypes capable of depositing thin metal film onto plastic substrates at high speeds using roll-to-roll processing. By altering the film transport system, high-speed deposition is possible for PET and other film types with low thermal resistance. Two gas lines are available, enabling deposition of oxide films through reactive sputtering. This technology is expected to be applied to production of display-related products, photovoltaic cells, OLEDs, etc.

With a primary focus on automotive press dies and resin dies, Yamamoto Manufacturing's dies department provides complete technical support for everything from production process planning to design, trials and start-up of actual production. The company has direct business dealings with automotive makers in Japan and overseas, undertaking cutting-edge manufacturing operations throughout its global network. Yamamoto Manufacturing actively implements IT to achieve short delivery times, high quality and low costs. They also develop dies for CRFP (carbon fiber-reinforced plastic), a new super-strong, lightweight material that contributes to energy savings.

Miyata Iron Works Co., Ltd.

General machinery

Manufacturing large-scale machinery and equipment

Utilizing its unique factory—one of the few in Shikoku equipped to handle the manufacture of large machinery—this company receives orders from major companies in the heavy industry field and manufactures steelmaking, papermaking and hauling equipment and other types of large-scale manufacturing machinery, making use of a production process that includes everything from planning to assembly. Each of the company's versatile workers is highly skilled in cutting, welding, assembly and other machining and processing techniques, and the company is highly regarded by its customers for its dedicated approach to manufacturing and high-quality products.

Apprize Inc. / Aprise Co., Ltd.

Electric machinery

Product Development Using Super Low Viscosity Thermoplastic Resin

A thermoplastic prepreg with excellent strength and toughness has been developed, which solves the problems with conventional fiber-reinforced plastic (FRP). In addition, it achieved the world's first success in using one mold for simultaneously performing three steps: polymerization, forming, and outsert molding (molding other resin simultaneously) for matrix resin. This makes it possible for the product to be used in precision equipment and medical equipment that FRP cannot accommodate. Currently development and production is aiming for a low cost with high quality based on knowledge accumulated through electronic equipment development that is the company's basic industry.

Revenue: Non-disclosure

This company's machines, which are used in place of human labor in manufacturing plants, operate based on comprehensive and integrated design. The company provides superb factory automation equipment, utilizing their ability to meet all customer needs and provide top-notch finishing and support. The HAW web guiding system, a vital component in sanitary product manufacturing lines, accounts for an overwhelmingly large domestic market share because it is maintenance-free so it won't break down, it is extremely easy to operate, and its settings can be completed in a short amount of time. Wintec's products are supported by the "WinWin Association," a collaboration between more than 30 different companies involved in parts manufacturing, metalworking and other fields.

The company's products have received CE marking to enable sale in the EU, so increased sales in Europe are expected.

Coil-winding technology—the backbone of motive power generation

This company possesses excellent skills and technology in making wound electromagnetic motors, which are crucial for every source of motive power. They have developed their business with a focus on the manufacture of special-use electromagnetic coils and the maintenance of industrial motors. The maintenance department staff have high technical abilities capable of addressing any problems with motors made by other manufacturers. In response to the current direction of manufacturing in Japan where many motor makers have been relocating production overseas and depleting Japan's coil-winding experts, they train their young employees thoroughly to help them acquire skills. This is one of their efforts to offer high-quality products and excellent service to their customers.

Developer of high-precision systems, customized to satisfy customers' needs

This company develops and produces various kinds of hardware and software in compliance with the requirements of their customers. As to hardware, they develop and manufacture circuit boards for off-the-shelf devices, inspection devices, and jigs for industrial use. This company also develops commercially-supplied equipment such as battery protection circuits, camera mounting, and color LCDs. In addition, they manufacture a variety of inspection devices for the production process control of these products.

As to software, this company develops software for business applications such as database packages for order and cost control and technical data analysis packages. Regarding software for production processing, they develop system control packages for image inspection devices with built-in cameras and for measurement/inspection, as well as firmware for embedded devices. This company meets each requirement from their customers covering both hardware and software consistently and meticulously.

High Quality Control Boards Using Reliable Technology

Okada Electric Corporation started as a provider of electrical work for middle and small scale paper factories, and grew by responding to all kinds of customer needs related to factory automation. Through years of accumulating experience and technology, the company is an expert in design, manufacturing, and installation of paper factories, drainage processing plants, and control boards for factory machinery and plants that need complicated controlling. The company is one of the few in Japan that holds the technology for designing and manufacturing switchboards that adhere to international standards in various countries across the globe. The company provides a high quality system that solves the problems that customers have.

High-tech LED lighting from Ehime

Ever since the March 2011 Fukushima Daiichi Nuclear Power Plant accident in Fukushima, people have begun to question the safety of nuclear power generation while facing energy shortages in Japan. As part of energy-saving measures, OBU has been developing, manufacturing and selling LED lighting products in an effort to contribute to society.

The company's seamless, large-sized, internally-illuminated LED signboard products prevent shadows and give off naturally vivid light. Aside from adopting straight-tube LED lights to drastically reduce energy consumption compared to standard lighting products, the company has also developed under-shelf lighting to clearly illuminate products display arrangements. OBU provides consultations on and proposals for the introduction of LED lighting in offices, shops, commercial facilities, etc.

Businesses: Manufacture of control panels and switchboards for large equipment such as cranes and various industrial machines, integrated production from design to final inspection by cooperation with our affiliate company: Nishioka Ironworks Co., Ltd.
Revenue: 727 M Yen (as of May 2018)

Nishiki Densoh, Co., Ltd. was created when the electric controller division of Nishioka Ironworks, Ltd. was spun off as an independent company, and it handles thin-plate fabrication and coating operations for the now-affiliated Nishioka Ironworks. Moving forward, Nishiki Densoh aims to serve as a systems development company, providing both hardware manufacturing services as well as software control-field services.

The product in which unit-type control panel for large-sized cranes was included pictured below is an excellent example of one product produced by combining the strengths of both companies: thin-plate fabrication and control technology.

An electronics think tank that understands customer needs

Operating out of the industrial city of Niihama, Cyber handles electronic design, software design, control design and manufacturing, and more as part of its efforts in automation and labor efficiency improvements for manufacturing equipment and machinery. One product type developed by the organization is its automated hardening-time measurement equipment, which measures hardening time for thermosetting resin by utilizing the common agitation approach. They have developed and patented a meter used to detect hardening progress via torque.

Although this electronics think tank organization is small, it has drawn significant attention from various fields for its ability to meet advanced needs.

Accelerate state-of-the-art medicine Gas-phase method nucleolytic degradation/decontaminant "Biovector"

The new, highly advanced technology anticipated in medical treatment: vaporized nucleic acid resolution technology (Patent: granted 2 in Japan and in 5 countries, under examination in 3 countries). Conquers in a very short time the problems that existed in prior technology, such as nucleus contamination, spread of the antibacterial spectrum, and germ-free control. Uses Sealive technology to make a controllable, sterilized DNA/RNA-free environment. Is being developed for anticipated use in medical treatment and sterilized pharmaceutical sites (research paper in preparation for submission).

In the field of space science, the company also developed with a highly reliable design and technology, for electronic circuits, substrates, functional modules and other components installed in observation satellites and other types of scientific satellites.

System Development using Cutting-edge Technology

This company has dealt with a significant number of image-recognition systems and has developed applications of Neural Network modeling the mechanism of cranial nerves, and various kinds of identification algorithm. Complex recognition, which was unachievable with conventional computers, is now possible.

Applying this technology, they have developed "Banknote sorter" and "Medal identifier". They have also created a system to control motors playing a vital role in home electric appliances and manufacturing machinery. With efficiency, they continue to offer innovative systems and products in the rapidly-changing technological industry.

Actively taking on difficult-to-machine materials

Tanaka Giken's strength lies in its ability to cut difficult-to-machine inconel, lath panels and other nickel alloy materials used in aircraft engines, gas turbine parts, etc.

The company also handles ultra-high-precision micro-fabrication for prototype products, including measuring devices installed in medical equipment and space-science-related equipment. They possess advanced technology for difficult three-dimensional forming, and their workers choose from hundreds of cutting tools and skillfully use their five senses, including sense of sight, hearing and smell, to operate machinery and perform cutting operations.

UZUSHIO Electric Co., Ltd.

Realization of smart ships utilizing vessel big data

BEMAC started out in sales and charging of storage batteries for fishing boats, and grew into a general contractor providing electric equipment and information machinery to a large merchant fleet. Currently, the company's products are installed on more than 5,000 marine vessels around the world.

The company's newly proposed ship-to-land information integration system enables land-based offices to make use of information collected via Internet networks from ships using engine monitoring equipment (data loggers). Services for safe ship operation such as preventive maintenance and failure prognosis are provided by using vessel big data.

HOKUTO Inc.

A unique development group serving as leaders of our time

Hokuto's unique product line has garnered trust from customers in the marine products field: the company's strength lies not only in its product performance, but also in its staff, a highly unified group specialized in various fields with high-level development and customer response capabilities. The company's specialty is brushless DC motors, but it also develops a wide range of other products. Recently, the company has been moving forward full-pace with improvements to existing products, while also pouring its efforts into commercialization of new products, such as high-efficiency wind turbine generators and dryers that fully utilize the effects of far-infrared radiation.

Rearun Co., Ltd.

One-of-a-kind LED lighting designed in pursuit of true originality

Rearun has developed, designed and sold lighting products for many years. Their LED panel light products include embedded-type flat-panel lighting units designed to be the same size as commonly-used decorative plaster ceiling boards. Thanks to high energy efficiency, cost savings and excellent design characteristics, these products are expected to make a major impact on the market. The company's ultra-lightweight LED fluorescent tubes boast a weight of only 150 grams (5.3 ounces)—nearly half that of the standard 290 grams (10.2 ounces) seen in conventional products—and use a polycarbonate tube design that prevents scattering of glass shards upon breakage caused by impact. These fluorescent lights brightly illuminate the entire tube without giving off harsh, glaring light that strains the eyes.

ASAKAWA SHIPBUILDING Co., Ltd.

Completely unique chemical tankers

Asakawa Shipbuilding's chemical tankers carry various types of liquid chemicals, refined oil products and more. The company was quick to adopt stainless steel tanks—a type of tank whose production management is difficult—which won the company's chemical tankers fame around the world. The company's energy-saving "friend fin" technology, which has been patented for mid- and small-sized ships, reduces rotational flow behind the propeller to improve propulsive efficiency. This technology enables a 6%–8% energy use reduction. It is currently used in nearly 200 vessels, contributing toward more environmentally friendly operations.

Progressive shipbuilding that contributes to local communities, the world and the future

Higaki Shipbuilding possesses unique technologies enabling construction of cargo ships, chemical tankers, LNG carriers, cement carriers and other types of ships, for which they have received high praise both in Japan and abroad. The company's mid-sized transport ships also account for one of the top market shares in their industry.

In 2015, the expansion work of the slip was completed. The company's ship building record of 700 vessels since its founding continues to grow both through a project to build ships that respond to the size increase of inshore boats, and a project to build "eco ships" that take into account recent strict environmental regulations.

Building low-cost, ultra-safe scaffolding

Conventional scaffolding construction and removal requires large amounts of money and numerous seasoned workers. And because work on scaffolds is dangerous, many workers used to lose their lives every year. In order to solve these problems, this company developed "rack scaffolding."

Using this type of scaffolding, inspections and paint repair for bridge piers and buildings, as well as other types of work, can be safely carried out on top of movable platforms. Furthermore, this scaffolding offers the benefit of reduced costs thanks to fewer required materials.

No.1 Construction Volume in Japan Total Construction Work Completed: 2,500 Ships

Following the corporate mission "growing with ship owners," Imabari Shipbuilding always ventures to the future and tackle new possibilities in shipbuilding for the new era. Founded in 1901, we have built new ships used in oceans across the globe for over 110 years. Our group owns 10 construction yards and three operation departments in the Seto Inland Sea. With our extensive accomplishments and experience as a shipbuilder, we seek a new transportation system that allows environment friendly, faster, and safer marine transport. Through building various ships that will support marine transport, we will contribute to developing a better society, and tackle new possibilities for shipbuilding for the new era.

Using QR codes to solve data management problems at once!

There are approximately 20,000 farmer's markets throughout Japan. We have devised Japan's first producers' direct information management system, which issues price labels from producers and distributes emails about sales information. In 2014, in order to solve the problems of management in an ever-changing farmer's market, we have developed a new system that uses QR codes instead of barcodes, called Shinsanchoku Hanjo-kun. Thus, the system facilitates the settlement process, which was difficult due to the increased number of items, including expiration dates and so on.

In addition, we are working on a new service which looks at the farmer's markets as health care bases.

An electronic medical chart widely-supported by obstetricians and gynecologists

"f-Kartet", **an obstetrics and gynecology specialized electronic medical chart developed by practicing obstetricians and gynecologists, has functions that are truly needed in the medical setting.** That is why it is chosen by a large number of clinics. Different from other medical departments, obstetric examination or treatment has its own unique medical process: prenatal checkup, hospitalization, delivery, etc. Therefore, the usual electric medical charts couldn't provide the support needed for obstetrics. We can say that "f-Kartet" is a highly competitive product focusing on a niche market. Its growth is supported by clinics all over Japan from Okinawa to Hokkaido, and we look forward to its future development.

Digital radio system using smartphone replaces analog radios.

"Mobirea Radio System" can be used anywhere if within range of cellular transmission waves. With Mobirea, no radio license, no base station and no relay station are needed, so you can invest in wireless digitization for little initial cost. The system can pinpoint the location of a vehicle using GPS. By connecting the system to meters or emergency switches, it can automatically receive information about the vehicle's status, it enhances useful functions with apps and/or devices. For example navigation system, drive recorder and many functions. Another attractive characteristic is that it can be used in a wide variety of industries, including municipal fire trucks and taxi radio. Patent pending.

Meeting the demands of sophisticated, leading-edge university hospitals

By closely listening to and following the needs and demands of medical workplaces while making use of systems developed in-house—including DocuMaker for creating documents, the Clao image filing system, and others—FINDEX proposes comprehensive medical document and image filing and management solutions. These enable centralized, unified management of medical reference letters, medical certificates, image results from examinations (echocardiograms, endoscopies, etc.) and other documents and images traditionally handled in handwritten or printed paper formats only. Because a single FINDEX system can be used to meet the needs of multiple departments, it is possible to introduce highly-effective new systems while keeping initial costs down. The company's systems are installed and used at approximately 80% of all national university hospitals in Japan, and they show great potential for government and corporate document-management applications as well.

Harnessing the power of fermentation to protect your health

The safe, reliable and high-quality "Rakuren" family of products are made by using locally produced, fresh, raw milk and thoroughly managed for quality and hygiene based on HACCP, TQC and ISO standards.

The 8020 Yogurt and 8020 Nomu Yogurt products were developed based on the L8020 lactic acid bacterium, which was discovered by Professor Hiroki Nikawa, Hiroshima University Faculty of Dentistry. Continuing joint research on lactic acid bacteria is being conducted in cooperation with Ehime University, Okayama University and the Ehime Institute of Industrial Technology.

Confidence in the freshness of fish and their taste

In order to offer their customers the flavor of small-sized fish, only fresh ingredients have been used to process and season for nearly 45 years. Okabe manufactures safe and high-quality products with the help of thorough quality control. Okabe has also obtained HACCP and ISO9001 certificates.

Another asset of this company is aggressive product development. These efforts include establishing new processing techniques, collaborating with other industries and utilizing new kinds of ingredients. A snack exclusive factory is enlarged in June, 2018. The seasoning processing technology grown up to now is also applied to farm products processing, and seasoning processing nuts kinds have been started to produce in earnest.

β -cryptoxanthin of three mandarin oranges in each drink box

For three years starting in 2010, this company has undertaken research on the functionality of β -cryptoxanthin found in mandarins as part of a technological development project for practical applications under the Ministry of Agriculture, Forestry and Fisheries.

During this research project, the company developed technology to further increase concentrations of β -cryptoxanthin in mandarin juice, successfully creating its "POM Ashtano-karada" product containing the same amount of β -cryptoxanthin in one juice box (125 ml) as three mandarins but with only the calories of one mandarin. This product is a direct commercialization of the mandarin juice used in scientific tests to verify the effects of β -cryptoxanthin.

A world first! Easy and delicious honey sheets

Simply place a Honey Sheet, this unique world-first product, on a slice of bread and heat it for instant honey toast. These sheets are made from honey, butter and agar, which are uniquely blended according to the company's specific ratios, superheated, cooled, shaped and sliced into sheets. The sheets can be placed between slices of bread for an easy-to-make sandwich that is delicious on its own. Furthermore, calories can be calculated easily based on the number of sheets used. The company also manufactures and sells a wide range of other honey-related processed foods.

Steamed whitebait with a focus on freshness

This company sells "Fukushima-san no Kama-age Shirasu" (Fukushima's whitebait cooked in a large kama pot), as well as other processed whitebait products, dried young sardines and more. The whitebait used as these products' main ingredient is caught using 12 fishing boats owned by the company, and various methods are employed on the boats to preserve the freshness of fish that are caught. In the factory, which is outfitted with cutting-edge equipment, there is a steamed whitebait production line (the first of its kind of Japan), a kama-pot-cooked whitebait production line, and more. To preserve the freshness of fish brought in from the port, production processes taking less than an hour.

The softness of dried fish—eat everything, including the bones!

This processed seafood product was created using bone-softening technology developed through cooperative industrial, academic, civil and government efforts. Because both suppliers and users can use this food product without worrying about bone hardness, it has been introduced in a large number of facilities for the elderly and meal-providing facilities.

Plans are under consideration to expand this product's use to other facilities, including hospitals and food service industry facilities. In addition, the product is being introduced into school lunches to prevent decline in fish consumption among youth, which further contributes to society in terms of dietary education and promotion of good health.

A flavor and fragrance that surpasses that of raw citrus fruits

"Ka no Ka" is a sugary candy that contains the peel of citrus fruits, which until now were not used effectively as food ingredients. Among citrus fruits produced in Ehime, Iyokan oranges, lemons, and kawachi-bankan pomeles are chosen as ingredients because they are suitable for sugaring. By using a unique sugar candying technique, you can enjoy the moist texture and natural fragrance of the fruit. And it isn't sticky when you hold it with your fingers either.

Only sugar and starch syrup, and vitamin C (acidulant) are used in the candying process, with absolutely no additives. No artificial scents or dyes are used in this product.

Rye grown in Ehime Prefecture for healthier living

Maeda developed its "Hadakamugi-batake no Fuwafuwa Pan no Moto" (Rye Field Fluffy Bread Mix) and "Hadakamugi-batake no Pancake Mix" (Rye Field Pancake Mix) products using rye from Ehime Prefecture, Japan's top producer of the crop. Rye contains 4 times the dietary fiber of brown rice and 24 times that found in white rice, making it easy to take in daily quantities of dietary fiber required for healthy living (20-25 grams). In addition, the company utilizes oxygen in glutinous wheat and black soybeans to create natural GABA (γ-aminobutyric acid) from glutamic acid. This GABA is used to make "GABA Gohan no Moto" (GABA Rice Mix) and "GABA Kinako" (GABA Roasted Soybean Flour), which facilitate easy intake of naturally derived GABA. Home and office versions are available for both of these products.

SUGOWAZA

Nihon Shokken Holdings Co., Ltd.

Foodstuffs

At the forefront of food culture and blending power

Nihon Shokken Holdings has become a household name through its familiar "Bansankan" yakiniku (grilled meat) sauce commercials. Since the company's founding, its strength has been in its power to develop blended flavoring ingredients. Currently, the company ships more tare sauce products than any other company in Japan, and its industry-use "Kara-age no Moto" Japanese-style deep-fried chicken batter accounts for a large share of the market.

The company constantly delivers new information on food culture to society via its world-leading, state-of-the-art food product manufacturing line and cutting-edge research and development facilities. New and innovative ideas can be found in abundance on the company's expansive grounds, as seen in the global-themed garden, the world's first museum based on the concept of food, the "KO Palace Plant" where production line tours are available, and more.

Flavorings containing natural taste and savoriness

A pioneer in natural flavorings, this company masterfully utilizes biotechnology to manufacture flavor extract from 100% natural meat and fish ingredients. Beginning with participation in a Ministry of Agriculture, Forestry and Fisheries project in 1988, the company has undertaken development of functional food ingredients with biological regulatory effects that include blood pressure control and improved calcium absorption.

The company achieved HACCP certification in 1998 and implemented a quality control system based on global standards. The company has also been awarded 41 patents, with 63 patents in total if pending patents are included.

Everyday KOTTA ("strong bones") to compensate for insufficient calcium intake

"KOTTA" refers to a paste made by finely mashing fresh fish (bones and all) raised and caught in the Uwa Sea, and it also refers to processed food products made using this paste as the main ingredient. Through high-temperature high-pressure processing, fish can be reduced to paste while depleting only a small amount of its nutritional content. In addition, the company also offers freeze-dried powders that can be added easily to food and drinks. Either of these product types is easy to work with, enabling use in wide variety of applications including school lunches and meals for elderly care facilities. Their breadcrumb-coated fried hamburger steaks with sea bream or yellowtail added, sea bream cream croquettes, and other processed food items can be cooked straight from their frozen state and laid out on the dining room table in no time, earning the company high praise from its customers.

Instant ramen ingredients and other such foods are conventionally air-dried and sliced into spiral shapes for use as food products, but it is difficult to reconstitute them even by using hot water. As a result, kamaboko fish-paste loaf, chikuwa tubular fish-paste cakes and other such ingredients lose much of their original texture and feel. That was why, this company developed new freeze-dried chikuwa, fish dumplings and other such ingredients. These products show improvement in problematic aspects of air-dried foods, as they can be easily reconstituted by hot water and the original firm texture found in fish paste products can be restored.

Utilizing all the flavors and nutrients of citrus fruits—peels and all!

With growing activities based primarily out of organic JAS-certified orchards, Misaraen leverages useful microorganisms rather than relying on agrochemicals in order to produce healthy, wholesome citrus fruits. The company harnesses the power of enzymes via single-cell conversion technology: this enables separation of single cells intact (rather than destroying them), with nutrients, savory and bitter tastes, pigments, and so forth still contained within the cellular membranes. Misaraen has begun producing their "Marugotto" fruit and vegetable pastes in this manner and selling them to customers.

Mandarin oranges in Margotto is a paste made using the entire fruit, including the skin, and comes packed with various nutrients including β -cryptoxanthin. The paste has a delightfully thick texture complemented by naturally-occurring bitterness and rich flavor.

Environment Friendly Water-based Flexographic Printing / Process

Seki uses water-based flexographic printing / process for soft packaging that includes little volatile organic compounds (VOC) in its ink, and the amount of ink applied is less than half compared to gravure printing. No VOC means no combustion treatment, which leads to a great reduction in CO2 emissions.

95% of soft packaging use gravure printing today, but this involves various environmental issues and health issues for the workers due to residual solvent, residual odor, and the use of solvent type adhesive for laminating. Environmentally friendly and safe water-based flexographic printing is the printing and processing technology of the future.

Inter-industry collaboration for pesticide-free, artificial-light growing of functional vegetables

Berg Earth is an agribusiness company whose activities center on the production and sale of vegetable seedlings. A JASDAQ-listed corporation, they boast the leading domestic market share in Japan for seedling grafting and release one innovative product after the next, refusing to limit themselves to traditional approaches and concepts.

As a government-recognized "verification-project company for establishing cutting-edge agricultural models via agriculture-finance collaboration," in fiscal 2015 Berg Earth developed low-cost growing equipment that uses only artificial light. By working together with steelmakers, light sources manufacturers and other such producers, Berg Earth has achieved systems providing stable, pesticide-free growing environments and production throughout the year, enabling production of functional vegetables and seedlings.

For full-artificial-light, low-cost vegetable seedling cultivation equipment, you can count on Berg Earth!

Northern European windows and doors that provide comfort even at -30°C/-27°F

One of Japan's few log house builders, Forest Crew imports entire high-quality material sets directly from Finland. They make use of close relationships built up over the years with local window-making factories to build windows, doors and other housing elements suited to Japan's climate, customs and traditions.

The company's unique wooden windows and doors, made with triple-pane glass for high airtightness, have undergone JIS A 4710-based thermal insulation testing (designed for such openings in houses/buildings) and been proven usable in Japanese housing. These products exhibit performance on par with leading global products while maintaining prices nearly equivalent to those of standard domestic wooden sash windows/doors made and sold in Japan. They also fully customizable in terms of size, form, color, etc.

in **EHIME** 189選

<http://www.sugowaza-ehime.com/>

Publicizing Ehime's "Sugowaza" at once

Due to the public advertisement of the superior technology and products of those manufacturing companies that are the pride of Ehime, 189 companies and 248 technologies officially recognized by the prefecture have been used to build the "Ehime Manufacturing Companies 'Sugowaza' Database." The database will assuredly facilitate "business matching" between different industries.

Introduction of the characteristics of Ehime's industry and the industrial clusters in each region

It gives a presentation of Ehime prefecture's industrial structure and regional industrial clusters as well as the characteristics of Ehime's industry that utilize the unique resources of each region. Please employ it as a helpful tool to expand business opportunities.

Easily search corporate information

Searching the database is extremely easy and convenient. Not only can you use the free word search function or search by company name (arranged by Japanese syllables), but you can also search by specific technology, industry, or location. Information on "No.1 in Japan" is displayed in an understandable way.

※The website only supports Japanese

No.1 or Only One in Japan!

01	AdMeTech Co., Ltd. A unique tumor therapy device (electrocautery) for animals	Only one	P19
02	ASAHIKYOHAN CO., LTD. Freshness and flavor are crucial! Top domestic share in number of packs processed!	No.1	P32
03	Berg Earth Co., Ltd. "Low-cost growing equipment that uses only artificial light" for vegetable seedlings is only one	Only one	P35
04	co-op Ryo ka Four-meter ultra-wide jacquard weaving—top in Japan	No.1	P5
05	COSMO SEIKI INC. No. 1 domestic market share in darts (plastic flight products)	No.1	P13
06	Daisho Tekkosho Co., LTD No. 1 Japanese market share for units sold in specialized paper manufacturing equipment	No.1	P23
07	Daiwa Packaging Systems CO., LTD World's fastest fully-automated carton formers for cardboard assembly!	No.1	P23
08	FINDEX Inc. Systems that comprehensive medical document and image filing and management solutions are installed at approximately 80% of all national-university hospitals in Japan	No.1	P31
09	Fujiwara Chemical Co., Ltd. No. 1 share in Japan in sales of diatomite finish coating, which helps control room humidity and temperature, absorbs foul odors and more	No.1	P11
10	Fujika Inc. Clapping type firecrackers – the only one in Japan	Only one	P35
11	Fukusuke Kogyo co., Ltd. Leader in Japan in manufacture of specification-size polyethylene bags	No.1	P10
12	Goshika Paper Co., Ltd. Top domestic market share in color kyohana-gami decorative paper, a vital part of school/company sports events, the Tanabata star festival and more	No.1	P6
13	Hattori Paper MFG. Co., Ltd. No. 1 domestic share in electrolyzed alkaline water sheets—harnessing the power of safe-ingredient electrolyzed water for cleaning!	No.1	P7
14	HOKUTO Inc. Top market share in Japan for electric fish-scale removers—recommended by professionals!	No.1	P28
15	IMABARI SHIPBUILDING CO., LTD. No. 1 domestic market share for new ships built	No.1	P29
16	IURA CO., LTD. The largest share of stretchers installing a transfer device in the domestic market	No.1	P19
17	Iyoya Towel co. No. 1 manufacture of towels with interwoven pictures	No.1	P4
18	IWAKITEC CO., LTD. Top producer in Japan (production volume) of container ship hatch covers	No.1	P29
19	KANEKO Co., LTD. No. 1 domestic share in party crackers	No.1	P34
20	KAWANOE ZOKI CO., LTD. Top manufacturer in Japan for household-product paper machines and packaging machines with fully automated roll take-up	No.1	P21
21	Ken Matsuura Racing Services Co., Ltd. No. 1 share in Japan for internal combustion engine parts used in F1, Moto GP and other familiar motor sports	No.1	P13
22	Marusan Industry Co., Ltd. No. 1 domestic market share for total sales of cosmetic cotton pads, cotton products for medical use and similar products	No.1	P9
23	Marutomo Co., Ltd. Savoriness and fragrance that set these products apart: genuine direct-roasted bonito flakes for the No. 1 domestic market share	No.1	P34
24	MARUYASU Inc. Labor-saving metering and mixing devices for film production claim No. 1 Japanese market share	No.1	P24
25	MENDORI INFORMATION TECHNOLOGY CORPORATION Top share in Japan in emergency Web notification systems (enabling users with hearing/speech impediments to contact 119, the phone number for fire/medical emergencies)	No.1	P31
26	Miki Tokusyu Paper Mfg. Co., Ltd. No. 1 wetted nonwoven fabric product lineup in the world	No.1	P7
27	MIURA CO., LTD Top domestic market share in small-size once-through steam boilers	No.1	P25
28	Nihon Shokken Holdings Co., Ltd. Japan's leader in shipping volume for tare sauces—an indispensable ingredient in all types of cooking!	No.1	P33
29	NIPPON CAREER INDUSTRY CO., LTD The leader in Japan in fully automated slicing of tender meat, including folding and arrangement of slices into neat rows	No.1	P23
30	OKABE CO., LTD. The top seller of seasoned small-sized fish delicacies in Japan	No.1	P32
31	PHC Co., Ltd. Top market share in Japan for domestically produced sensors used in household blood-sugar measurement devices	No.1	P28
32	RS Company Ltd. "Safety bolt"—Japan's only eccentric bolt	Only one	P11
33	SHI-ATEX Co., Ltd. Completely unique semiconductor wafer ion irradiation services and neutron radiography technology	Only one	P22
34	Sakawa Co., Ltd. Top share in Japan for electronic blackboards with integrated projectors	No.1	P5
35	Sealive.Inc. Best in Japan in nucleolytic technology (new and much-anticipated sterilization equipment technology)	No.1	P27
36	Shimizu Co., Ltd. No.1 domestic share in decorative tapes for event	No.1	P6
37	Suntechno Kuga Co., Ltd. Masterful techniques for blowfish skin-removal machines that account for the No. 1 domestic market share	No.1	P14
38	TAKECHI Co., Ltd. Japan's leader in building gaskets, refrigerator gaskets and automotive plastic magnets	No.1	P10
39	Takenaka Wire Cloth Co., Ltd. The crimped wire mesh "bamboo screen" is only one.	Only one	P16
40	Tokiwa Kougyou Tokiwa tea bags—a common household item—account for the top market share in Japan	No.1	P7
41	Toyo Co., Ltd. No. 1 domestic share in industrial-use, heat-resistant, cut-preventing protective clothing	No.1	P4
42	USHIO REINETSU CO., LTD. No. 1 share in Japan in shipboard air conditioning and refrigeration equipment and elevators	No.1	P20
43	Wintec Co., Ltd. No.1 domestic share in web guiding system (corrects base paper movement to ensure straight direction on paper diaper production lines, etc.)	No.1	P26
44	YAMAKI Co., Ltd. Top handler of dried bonito in Japan	No.1	P34
45	Yoneyama Agricultural Machinery Manufacturing Co., Ltd. Facilitating easy performance of work anywhere: "rack-and-rail" movable hanging scaffolds boasting the No. 1 domestic share	No.1	P29

※The shares and rankings are reported by each registered company.

Databases of Ehime's four SUGOI categories

Excellent Goods Ehime Takes Pride In (Sugomono), Ehime's Amazing Tastes (Sugoaji), Ehime's Amazing Techniques (SUGOWAZA) and Ehime's Amazing Venture Capital Firms (SugoVen.)

Ehime Prefecture is home to a wide range of manufacturing and production activities rooted in their local history and culture. In addition to the SUGOWAZA included in this booklet, we have created databases for Sugoaji, which include various Ehime food products and ingredients from both land and sea; Sugomono, products that convey the unique appeal of Ehime; and SugoVen., a selection of promising, local venture capital firms. These databases are packed with unique and SUGOI (amazing) products, technologies and more. We hope you will make use of all that Ehime has to offer in these four SUGOI categories to help your company achieve technological innovations and expand sales both domestically and globally.

* Numbers of companies and other information is current as of June 2019. We plan to add more in the future.

Ehime Prefecture Producers Sugoaji Database

Introducing 532 top-quality, local-brand food products and ingredients packed with Ehime love. These include a wide array of citrus fruits, other fruits and vegetables, livestock products, marine products, daily foods, grocery items, sweets and candies, alcohol, and more, all listed by category in the database. Each product is shown along with a photograph, recommended retail price, ingredients, minimum purchasable case number/size, and other such details. We have also made it easy for buyers to contact individual producers.

Outstanding, Amazing Products from Ehime Sugomono Database

This database contains 185 amazing products (excluding food products) from 121 outstanding Ehime companies, all certified as "Sugomono" that convey qualities and appeal unique to Ehime Prefecture. They include products from craftspeople prefecturally designated as traditional specialty products makers, items made by young artisans carrying on the traditions and practices of past generations, and more. Sugomono products can enrich your personal life, and also be used/sold as personal or commemorative gifts.

Venture Capital Firms from Ehime SugoVen. Database

A database including 37 promising Ehime Prefecture companies that have been founded within the last decade or so and exhibit creative and novel products, technologies, services and/or business models, as well as 2 pioneering venture capital firms operating in the prefecture. These companies operate in a diverse array of fields and industries, including manufacturing, telecommunications, wholesale, retail, agriculture, forestry, general construction, lifestyle-related services, recreation/amusement, academic research and specialized/technical services, and others.
